Milestone # : 1

Date : 29-Sept-2025

Group Number : 73

Name	UBC Student #	UBC CSID	Email
Jaden Victor Majid	94916335	n6q1z	majid.jaden@gmail.com
Trevor Kozek	29541778	d7h3b	tkozek@student.ubc.ca
Raymond Lee	36028942	t7z4t	lraymond@student.ubc.ca

By typing our names and student numbers in the above table, we certify that the work in the attached assignment was performed solely by those whose names and student IDs are included above.

In addition, we indicate that we are fully aware of the rules and consequences of plagiarism, as set forth by the Department of Computer Science and the University of British Columbia

Domain

The domain of this application is a theme/amusement park, which includes ticketing and admissions, loyalty programs, on-site hotel stays, and ride management. The purpose of the project is to act as a data management and organization tool that connects these different areas, giving management clear oversight of operations.

The database will model a resort-style amusement park, which includes information such as the following:

- It will manage customer information, such as profiles and visit histories, as well as ticketing details like validity dates and premium purchases, including fast passes.
- On-site hotel reservations will also be recorded, storing data such as the number of guests, length of stay, type of room, and any rate modifiers.
- On the attractions side, the system will track ride requirements, like valid tickets, along with maintenance records and ride utilization rates.

A real-world example of this application is a family visiting a park like Disneyland during the Christmas season. They decide to stay at the on-site resort, where the holiday pricing includes a 1.75x rate multiplier due to demand. In addition to their hotel stay, they purchase premium fast-pass tickets that allow them to skip the line on three rides of their choice. Meanwhile, thousands of other guests are also at the park during the same period, with some staying at the on-site Disney hotel, some visiting for just one day, some enrolled in loyalty programs, and some completely new customers. Without a database management system, it becomes difficult for management to forecast demand, track guest activity, and deliver a smooth experience for everyone.

Data Specifications

The database will serve as the central information management system for the entire amusement park, bringing together customer data, ticketing, hotel reservations, loyalty programs, and ride operations.

The management team at the amusement park will be able to use it to access an overview of operations, from ticket sales and hotel occupancy to ride usage and loyalty member activity. Hotel front desk staff will rely on the system to look up guest reservations, apply seasonal rate modifiers, and manage the check-in and check-out process efficiently. Customers that are part of the loyalty program will also benefit from being able to view and track their loyalty points, and Season Pass Level. Finally, ride operators will use the database to scan tickets or fast passes and technicians will use it to log maintenance.
